

1.2.6 $480 = 50 + 100(v + v^2 + v^3 + v^4) + Xv^5$, where $v = \frac{1}{1.03}$, so that $X = 67.57$. If interest is .01 per month, then $v = \frac{1}{(1.01)^3}$ and $X = 67.98$.

$$1.2.7 \quad 100 + 200v^n + 300v^{2n} = 600v^{10} \rightarrow 600v^{10} = 100 + 200(.75941) + 300(.75941)^2 \rightarrow v^{10} = .708155 \rightarrow i = (.708155)^{-1/10} - 1 = .0351.$$

$$1.2.8 \quad \begin{aligned} \text{(a)} \quad & (20)(2000)[v + v^2 + v^3 + \dots + v^{48}] = 1,607,391 \text{ (at .75\%)} \\ \text{(b)} \quad & 1,607,391 + 200,000v^{48} = 1,747,114 \\ \text{(c)} \quad & X = 1,607,391 + .15Xv^{48} \rightarrow X = 1,795,551 \end{aligned}$$

$$1.2.9 \quad 750 = 367.85[1 + (1+j)] \rightarrow j = .0389 \text{ is the 2-month rate.}$$

$$1.2.10 \quad \text{With } X \text{ initially stocked, the number after 4 years is } X(1.4)^4 - 5000[(1.4)^{1.5} + (1.4)^{-.5}] = X \rightarrow X = 4997.$$

1.2.11 $1000 = \frac{100}{(1+j)^2} + \frac{1000}{(1+j)^3}$, and $1000 = \frac{100}{1+k} + \frac{1000}{(1+k)^3}$. It is not possible that $j = k$, since the two present values could not both be equal to 1000 (unless $j = k = 0$, which is not true). If $j > k$, then $(1+j)^2 > 1+k$ and $(1+j)^3 > (1+k)^3$, in which case the first present value would have to be less than the second present value. Since both present values are 1000, it must be the case that $j < k$ ($j = .0333$ and $k = .0345$).

$$1.2.12 \quad 1000(1+i)^2 + 1092 = 2000(1+i)$$

Solving the quadratic equation for $1+i$ results in no real roots.

$$1.2.13 \quad \begin{aligned} \text{(a)} \quad & \frac{d}{dt}(1+i)^n = n(1+i)^{n-1} & \text{(c)} \quad \frac{d}{dn}(1+i)^n &= (1+i)^n \ln(1+i) \\ \text{(b)} \quad & \frac{d}{di}v^n = -nv^{n+1} & \text{(d)} \quad \frac{d}{dn}v^n &= -v^n \ln(1+i) \end{aligned}$$

1.2.14 With an annual yield rate quoted to the nearest .01%, the annual yield i is in the interval $.11065 \leq i < .11075$.

Since the quoted annual yield rate is $\frac{365}{182} \cdot \frac{100 - \text{Price}}{\text{Price}}$ it follows that $.11065 \leq \frac{365}{182} \cdot \frac{100 - \text{Price}}{\text{Price}} < .11075$, or, equivalently, $94.767 \leq \text{Price} < 94.771$.

$$1.2.15 \quad \text{(a)} \quad P = \frac{1000,000}{1 + (.10)^{\frac{182}{365}}} = 95,250.52$$

$$\begin{aligned} \text{(b)} \quad P &= \frac{100,000}{1 + i \cdot \frac{182}{365}} \rightarrow \frac{dP}{di} = -\frac{100,000}{\left(1 + i \cdot \frac{182}{365}\right)^2} \cdot \frac{182}{365} \\ &= -45,239.03 \text{ if } i = .10 \end{aligned}$$

$$\frac{dP}{di} \doteq \frac{\Delta P}{\Delta i} \doteq -45,239.03 \rightarrow \Delta P \doteq -45,239.03 \cdot \Delta i.$$

If $\Delta i = .001$, then $\Delta P \doteq -45.24$.

$$\text{(c)} \quad P = \frac{100,000}{1 + i \cdot \frac{91}{365}} \rightarrow \frac{dP}{di} = -\frac{100,000}{\left(1 + i \cdot \frac{91}{365}\right)^2} \cdot \frac{91}{365} = -23,733.34 \text{ if } i = .10.$$

As the T-bill approaches its due date the $\frac{dP}{di}$ goes to 0.
